Some varieties of finite tree automata related to restricted temporal logics

Szabolcs IVÁN Joint work with Zoltán ÉSIK

Department of Computer Science University of Szeged

Ésik, Iván Application for Moore varieties

∃ ► < ∃ ► ...</p>

Let $0 \in R$ be a rank type. Δ is the ranked alphabet with $\Delta_n = \{ \vee^n, \top^n \}$ for each $n \in R$. We study the following automata:

 $\mathbb{A}_{EF^*} = (\{0, 1\}, \Delta)$ with the usual Boolean interpretations; $\mathbb{A}_{EF^+} = (\{0, 1, 2\}, \Delta)$ with

$$\vee_{\mathbb{A}_{\mathrm{EF}^+}}^n(x_1,\ldots,x_n) = \left\{ egin{array}{c} 0 & , \mbox{ if } x_i = 0 \ \mathrm{holds} \ \mathrm{for \ all} \ i; \\ 2 & , \mbox{ otherwise}; \end{array}
ight.$$

$$op_{\mathbb{A}_{\mathrm{EF}^+}}^n(x_1,\ldots,x_n) = \left\{ egin{array}{c} 1 & ext{, if } x_i = 0 ext{ holds for all } i; \\ 2 & ext{, otherwise.} \end{array}
ight.$$

Let $0 \in R$ be a rank type.

 Δ is the ranked alphabet with $\Delta_n = \{ \vee^n, \top^n \}$ for each $n \in \mathbb{R}$. We study the following automata:

 $\mathbb{A}_{EF^*}=(\{0,1\},\Delta)$ with the usual Boolean interpretations; $\mathbb{A}_{EF^+}=(\{0,1,2\},\Delta)$ with

$$\vee_{\mathbb{A}_{\mathrm{EF}^+}}^n(x_1,\ldots,x_n) = \left\{ egin{array}{c} 0 & , \mbox{ if } x_i = 0 \ \mathrm{holds} \ \mathrm{for \ all} \ i; \\ 2 & , \mbox{ otherwise;} \end{array}
ight.$$

$$op_{\mathbb{A}_{\mathrm{EF}^+}}^n(x_1,\ldots,x_n) = \left\{ egin{array}{c} 1 & ext{, if } x_i = 0 ext{ holds for all } i; \\ 2 & ext{, otherwise.} \end{array}
ight.$$

Let $0 \in R$ be a rank type.

 Δ is the ranked alphabet with $\Delta_n = \{ \forall^n, \top^n \}$ for each $n \in \mathbb{R}$. We study the following automata:

 $\mathbb{A}_{EF^*}=(\{0,1\},\Delta)$ with the usual Boolean interpretations; $\mathbb{A}_{EF^+}=(\{0,1,2\},\Delta)$ with

$$\vee_{\mathbb{A}_{\mathrm{EF}^+}}^n(x_1,\ldots,x_n) = \left\{ egin{array}{c} 0 & , \mbox{ if } x_i = 0 \ \mathrm{holds} \ \mathrm{for \ all} \ i; \\ 2 & , \mbox{ otherwise}; \end{array}
ight.$$

$$op_{\mathbb{A}_{\mathrm{EF}^+}}^n(x_1,\ldots,x_n) = \left\{egin{array}{c}1&, ext{ if }x_i=0 ext{ holds for all }i;\\2&, ext{ otherwise.}\end{array}
ight.$$

- We will characterize the Moore varieties $\langle \mathbb{A}_{EF^*}, \mathbb{D}_1 \rangle_M$ and $\langle \mathbb{A}_{EF^+}, \mathbb{D}_1 \rangle_M$.
- In order to do this we characterize first $\langle \mathbb{A}_{EF^*} \rangle_M$ and $\langle \mathbb{A}_{EF^+} \rangle_M$.
- We will show that the membership problem is decidable for all of them in polynomial time.

- *L* is definable in the tree logic $CTL(EF^{\odot})$.
- The minimal recognizer A_L of L is contained in the Moore variety (A_{EF[☉]}, D₁)_M.

Corollary: it is decidable for a regular tree language *L* whether it is definable in these logics.

For the EF⁺ fragment it was already proven by
 M. Bojańczyk and I. Walukiewicz, using different methods.

If the language *L* is given by \mathbb{A}_L , then we have a decision procedure of polynomial time.

The proof is based on the key lemma that Mon $\times \langle \mathbb{D}_1 \rangle_M =$ Mon $\times_M \langle \mathbb{D}_1 \rangle_M =$ ComDep \cap CwUnique.

▲□ ▲ □ ▲ □ ▲ □ ● ● ● ●

- $\langle \mathbb{A}_{EF^+}, \mathbb{D}_1 \rangle_M =$ ComDep \cap CwUnique \cap Com \cap MaxDep.
- $\langle \mathbb{A}_{\mathrm{EF}^*}, \mathbb{D}_1 \rangle_M = \langle \mathbb{A}_{\mathrm{EF}^+}, \mathbb{D}_1 \rangle_M \cap \mathbf{Stu}.$

Corollary. The definability problem of a tree language in the logics $CTL(EF^+)$ and $CTL(EF^*)$ is decidable.

In the case of $R = \{0, 1\}$ (so we have a string automaton) the properties are simplier:

- commutativity is trivial;
- maximal dependence is also trivial;
- component dependency implies componentwise uniqueness.

From this it follows that a regular string language L is

- definable in the logic LTL(F⁺) if and only if A_L is component dependent;
- definable in the logic LTL(F*) if and only if A_L it is both component dependent and stutter invariant.

This yields the same decision procedure as the characterization of Th. Wilke (1999).

This yields the same decision procedure as the characterization of Th. Wilke (1999).

Conclusions, open questions

- We have given an alternative proof of that the definability problem is decidable for the logic CTL(EF⁺).
- We have shown that the same problem is also decidable for the logic CTL(EF*).
- We have also shown that the EF*-definable tree languages are exactly the EF⁺-definable tree languages that are also stutter invariant. This extends the similar result of Th. Wilke concerning string languages.

The definability problem is known to be decidable for the fragments CTL(EX) and CTL(EX + EF).

Question: Can we solve also the definability problem for other fragments of CTL?
