What is a fuzzy set?

What is a fuzzy set?

Btw., what is a set?

“... to be an element...”

What is a fuzzy set?

Btw., what is a set?

“... to be an element...”

A **set** is a collection of its **members**.

What is a fuzzy set?

Btw., what is a set?

“... to be an element...”

A **set** is a collection of its **members**.

The notion of **fuzzy sets** is an extension
of the most fundamental property of sets.

Fuzzy sets allows a grading of **to what extent**
an **element** of a set **belongs** to that specific set.

What is a fuzzy set?

A small example

Let us observe a (crisp) reference set (our universe)

$$X = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}.$$

What is a fuzzy set?

A small example

Let us observe a (crisp) reference set (our universe)

$$X = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}.$$

Let us form:

The (crisp) subset C of X , $C = \{x \mid 3 < x < 8\}$

What is a fuzzy set?

A small example

Let us observe a (crisp) reference set (our universe)

$$X = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}.$$

Let us form:

The (crisp) subset C of X , $C = \{x \mid 3 < x < 8\}$

$$C = \{4, 5, 6, 7\}$$

(Easy! "Yes, or no" ...)

What is a fuzzy set?

A small example

Let us observe a (crisp) reference set (our universe)

$$X = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}.$$

Let us form:

The (crisp) subset C of X , $C = \{x \mid 3 < x < 8\}$

$$C = \{4, 5, 6, 7\}$$

(Easy! "Yes, or no" ...)

The set F of **big** numbers in X

What is a fuzzy set?

A small example

Let us observe a (crisp) reference set (our universe)

$$X = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}.$$

Let us form:

The (crisp) subset C of X , $C = \{x \mid 3 < x < 8\}$

$$C = \{4, 5, 6, 7\}$$

(Easy! "Yes, or no" ...)

The set F of **big** numbers in X

$$F = \{10, 9, 8, 7, 6, 5, 4, 3, 2, 1\}$$

(Yes or no? ... More like graded ...)

What is a fuzzy set?

Fuzzy is not just another name for probability.

What is a fuzzy set?

Fuzzy is not just another name for probability.

The number 10 is not **probably** big!
...and number 2 is not **probably not** big.

Uncertainty is a consequence of
non-sharp boundaries between the notions/objects,
and not caused by lack of information.

Statistical models deal with random events and outcomes;
fuzzy models attempt to capture and quantify nonrandom
imprecision.

What is a fuzzy set?

Randomness vs. Fuzziness

Randomness refers to an event that may or may not occur.

Randomness: frequency of car accidents.

Fuzziness refers to the boundary of a set that is not precise.

Fuzziness: seriousness of a car accident.

What is a fuzzy set?

Fuzzy sets

The paper

L. A. Zadeh, Fuzzy sets. Information and Control, Vol. 8, pp. 338-353. (1965).

A fuzzy set of a reference set is a set of ordered pairs

$$F = \{\langle x, \mu_F(x) \rangle \mid x \in X\},$$

where $\mu_F : X \rightarrow [0, 1]$.

A fuzzy set of a reference set is a set of ordered pairs

$$F = \{\langle x, \mu_F(x) \rangle \mid x \in X\},$$

where $\mu_F : X \rightarrow [0, 1]$.

Where there is no risk for confusion, we use the same symbol for the fuzzy set, as for its membership function.

Thus

$$F = \{\langle x, F(x) \rangle \mid x \in X\},$$

where $F : X \rightarrow [0, 1]$.

A fuzzy set of a reference set is a set of ordered pairs

$$F = \{\langle x, \mu_F(x) \rangle \mid x \in X\},$$

where $\mu_F : X \rightarrow [0, 1]$.

Where there is no risk for confusion, we use the same symbol for the fuzzy set, as for its membership function.

Thus

$$F = \{\langle x, F(x) \rangle \mid x \in X\},$$

where $F : X \rightarrow [0, 1]$.

To define a fuzzy set \Leftrightarrow To define a membership function

Fuzzy sets

Continuous (analog) fuzzy sets

$$A : X \rightarrow [0, 1], X \text{ is dense}$$

Discrete fuzzy sets

$$A : \{x_1, x_2, x_3, \dots, x_s\} \rightarrow [0, 1]$$

Digital fuzzy sets

If a discrete-universal membership function can take only a finite number $n \geq 2$ of distinct values, then we call this fuzzy set a digital fuzzy set.

$$A : \{x_1, x_2, x_3, \dots, x_s\} \rightarrow \left\{0, \frac{1}{n-1}, \frac{2}{n-1}, \frac{3}{n-1}, \dots, \frac{n-2}{n-1}, 1\right\}$$

Fuzzy sets

Membership functions

Outline

Fuzzy Sets

Fuzzy set
operations

Fuzzy sets in

Other types of
descriptors

Defuzzification

An application
in image
processing

Examples of membership functions that may be used in different contexts for characterizing fuzzy sets of real numbers close to 2.

Fuzzy sets

Basic concepts and terminology

The **support** of a fuzzy set A in the universal set X is a crisp set that contains all the elements of X that have nonzero membership values in A , that is,

$$\text{supp}(A) = \{x \in X \mid A(x) > 0\}$$

The **height**, $h(A)$ of a fuzzy set A is the largest membership value attained by any point. If the height of a fuzzy set is **equal to one**, it is called a **normal** fuzzy set, otherwise it is **subnormal**.

Fuzzy sets

Basic concepts and terminology

An α -cut of a fuzzy set A is a **crisp set** ${}^{\alpha}A$ that contains all the elements in X that have membership value in A greater than or equal to α .

$${}^{\alpha}A = \{x \mid A(x) \geq \alpha\}$$

The 1-cut 1A is often called the **core** of A .

Note! Sometimes the highest non-empty α -cut ${}^{h(A)}A$ is called the core of A . (in the case of subnormal fuzzy sets, this is different).

The word **kernel** is also used for both of the above definitions.

Fuzzy set operations

Standard set operations

For fuzzy sets A, B on a reference set X , given by the corresponding membership functions $A(x)$ and $B(x)$, standard set operations are:

$$\begin{aligned}\bar{A}(x) &= 1 - A(x) && \text{— fuzzy complement} \\ (A \cap B)(x) &= \min[A(x), B(x)] && \text{— fuzzy intersection} \\ (A \cup B)(x) &= \max[A(x), B(x)] && \text{— fuzzy union}\end{aligned}$$

for all $x \in X$.

Note: There are infinitely many different fuzzy complements, fuzzy intersections, and fuzzy unions!

Fuzzy intersections

Examples of t -norms frequently used

- **Drastic intersection**

$$i(a, b) = \begin{cases} a & \text{if } b = 1 \\ b & \text{if } a = 1 \\ 0 & \text{otherwise} \end{cases}$$

- **Bounded difference**

$$i(a, b) = \max[0, a + b - 1]$$

- **Algebraic product**

$$i(a, b) = ab$$

- **Standard intersection**

$$i(a, b) = \min[a, b]$$

Fuzzy unions

Examples of t -conorms frequently used

- **Drastic union**

$$u(a, b) = \begin{cases} a & \text{if } b = 0 \\ b & \text{if } a = 0 \\ 1 & \text{otherwise} \end{cases}$$
- **Bounded sum**

$$u(a, b) = \min[1, a + b]$$
- **Algebraic sum**

$$u(a, b) = a + b - ab$$
- **Standard union**

$$u(a, b) = \max[a, b]$$

Duality of fuzzy set operations

Examples of dual triples

Dual triples with respect to the **standard** fuzzy complement

$$\langle \min(a, b), \max(a, b), c_S \rangle$$

$$\langle ab, a + b - ab, c_S \rangle$$

$$\langle \max(0, a + b - 1), \min(1, a + b), c_S \rangle$$

$$\langle i_{\min}(a, b), u_{\max}(a, b), c_S \rangle$$

A bit more than forty years ago (1965), fuzzy sets were introduced by Zadeh. 14 years later (1979), Rosenfeld introduced fuzzy sets into image analysis ¹. The results obtained in the first five year period (1979-1984), are reported in (Rosenfeld 1984) ²; various definitions, methods for measuring geometrical and other properties and relationships related to regions in an image defined as fuzzy sets, are summarized.

¹A. Rosenfeld., Fuzzy digital topology. Information and Control, 1979

²A. Rosenfeld., The fuzzy geometry of image subsets. Pat. Rec. Letters, 1984.

Fuzzy sets in image processing

Fuzzy thresholding

Membership distributions assigned using

- Pal and Rosenfeld (1988)
- Huang and Wang (1995)
- Fuzzy c-means (Bezdek 1981) algorithms.

Fuzzy sets in image processing

The fuzzy shape analysis techniques addressed in (Rosenfeld 1984) are:

- Connectedness and surroundedness;
- Adjacency;
- Convexity and starshapedness;
- Area, perimeter, and compactness;
- Extent and diameter;
- Shrinking and expanding, medial axes, elongatedness, and thinning;
- Grey-level-dependent properties; splitting and merging.

Defuzzification

An application
in image
processing

The fact that (Rosenfeld 1984) is, during the last twenty years, still one of the main references in most of the papers dealing with fuzzy shapes, indicates not only its outstanding significance and quality, but also the lack of research and results in the field since then.

However, during the last ten years, there has been a steady increase in interest for fuzzy techniques in image processing...

Most definitions rely on cutworthiness.

- A **fuzzy straight/curved line** is a fuzzy set for which any α -cut, $\alpha \in (0, 1]$, is either empty, or a straight/curved line.
- A **fuzzy disk** is a fuzzy set whose non-empty α -cuts, for $\alpha \in (0, 1]$, are concentric disks.
- A **fuzzy ellipse** is a fuzzy set whose non-empty α -cuts, for $\alpha \in (0, 1]$, are ellipses with the same center, orientation, and eccentricity.

Features derived by aggregation over α -cuts

- Area/volume and other geometric moments
- Perimeter/surface area
- Moments (moment invariants)

Area of a fuzzy set

The **area** of a fuzzy set A on $X \subseteq \mathbb{R}$ is

$$\begin{aligned}\text{area}(A) &= \int_X A(x) dx \\ &= \int_0^1 \text{area}({}^\alpha A) d\alpha\end{aligned}$$

Area of a fuzzy set

The **area** of a fuzzy set A on $X \subseteq \mathbb{R}$ is

$$\begin{aligned} \text{area}(A) &= \int_X A(x) dx \\ &= \int_0^1 \text{area}({}^\alpha A) d\alpha \end{aligned}$$

or, for a digital fuzzy set A on $X \subseteq \mathbb{Z}$,
with level set $\Lambda(A) = \{\alpha_1, \alpha_2 \dots \alpha_n\}$

$$\begin{aligned} \text{area}(A) &= |A| = \sum_X A(x) \\ &= \sum_{i=1}^n (\alpha_i - \alpha_{i-1}) \cdot \text{area}({}^\alpha A), \end{aligned}$$

where $\alpha_0 = 0$

Perimeter of a fuzzy set

The **perimeter** of a fuzzy set A

$$\text{perim}(A) = \int_0^1 \text{perim}(\alpha A) d\alpha$$

Outline

Fuzzy Sets

Fuzzy set
operations

Fuzzy sets in
image
processing

Other types of
descriptors

Defuzzification

An application
in image
processing

Perimeter of a fuzzy set

The **perimeter** of a fuzzy set A

$$\text{perim}(A) = \int_0^1 \text{perim}(\alpha A) d\alpha$$

The **perimeter** of a **fuzzy step set** S given by a piecewise constant membership function μ_S , is defined as

$$\text{perim}(S) = \sum_{\substack{i,j,k \\ i < j}} |\mu_{S_i} - \mu_{S_j}| \cdot |l_{ijk}|,$$

where l_{ijk} is the k^{th} arc along which bounded regions S_i and S_j , defined by (constant-valued) membership functions μ_{S_i} and μ_{S_j} , meet.

Perimeter of a fuzzy set

The **perimeter** of a fuzzy set A

$$\text{perim}(A) = \int_0^1 \text{perim}(\alpha A) d\alpha$$

The **perimeter** of a **fuzzy step set** S given by a piecewise constant membership function μ_S , is defined as

$$\text{perim}(S) = \sum_{\substack{i,j,k \\ i < j}} |\mu_{S_i} - \mu_{S_j}| \cdot |l_{ijk}|,$$

where l_{ijk} is the k^{th} arc along which bounded regions S_i and S_j , defined by (constant-valued) membership functions μ_{S_i} and μ_{S_j} , meet.

Note:

- Requires estimation of the arc-lengths of the crisp sets.
- Only “horizontal” version.

Moments of a fuzzy set

Moments of a fuzzy set are among the first defined fuzzy concepts.

Geometric moments:

- The **moment** $m_{p,q}(A)$ of a fuzzy set A defined on $X \subset \mathbb{R}^2$, is

$$m_{p,q}(A) = \iint_X A(x, y) x^p y^q dx dy .$$

- The moment $\tilde{m}_{p,q}(A)$ of a digital fuzzy set A on $X \subset \mathbb{Z}^2$, is

$$\tilde{m}_{p,q}(A) = \sum_{(i,j) \in X} A(i, j) i^p j^q .$$

for integers $p, q \geq 0$.

The moment $m_{p,q}(S)$ has the order $p + q$.

Scalar descriptors of fuzzy sets

Inter-relations

All the definitions listed above reduce to the corresponding customary definitions for crisp sets. However, some inter-relations which these notions satisfy in the crisp case, do not hold for the generalized (fuzzified) definitions.

in image
processing

Scalar descriptors of fuzzy sets

Inter-relations

All the definitions listed above reduce to the corresponding customary definitions for crisp sets. However, some inter-relations which these notions satisfy in the crisp case, do not hold for the generalized (fuzzified) definitions.

For example: The isoperimetric inequality,

$$4\pi \cdot \text{area}(A) \leq \text{perim}^2(A),$$

gives us a way to define a measure of **compactness** of a set A

$$\text{comp}(A) = \frac{4\pi \cdot \text{area}(A)}{\text{perim}^2(A)},$$

Scalar descriptors of fuzzy sets

Defuzzification

An application
in image
processing

This compactness measure, for crisp sets, is the highest for a disk, for which it is equal to one. All other objects have a lower compactness.

However, for fuzzy sets and definitions given above, the isoperimetric inequality does not hold in general.

In fact, it can be shown that the compactness increases with an increase of fuzziness. A rather unintuitive result in deed.

Inter-relations

Bogomolny proposed (1987) modified definitions, such that they still reduce to their customary crisp counterparts, but the isoperimetric inequality, and also relations between length and area, are fulfilled for a wide class of fuzzy (continuous) sets. However, these definitions are often seen as less intuitive.

Inter-relations

Bogomolny proposed (1987) modified definitions, such that they still reduce to their customary crisp counterparts, but the isoperimetric inequality, and also relations between length and area, are fulfilled for a wide class of fuzzy (continuous) sets. However, these definitions are often seen as less intuitive.

For example: The **perimeter** of a fuzzy set S given by a piecewise constant membership function μ_S , is then defined as

$$\text{perim}(S) = \sum_{\substack{i,j,k \\ i < j}} |\sqrt{\mu_{S_i}} - \sqrt{\mu_{S_j}}| \cdot |A_{ijk}|,$$

where A_{ijk} is the k^{th} arc along which bounded regions S_i and S_j , defined by (constant-valued) membership functions μ_{S_i} and μ_{S_j} , meet.

(b)

(c)

(d)

Distances

Set to set distances

Distances between fuzzy sets

- a) Membership focused (vertical, co-domain)
- b) Spatially focused (horizontal, domain)
- c) Mix of spatial and membership (tolerance)
- d) Feature distances (low or high dimensional representations)

Distances

Point to point distance

Introduced as grey weighted distances (Rutovitz '68, Levi & Montanari '70) put in a fuzzy framework (Saha '02).

Distances

Point to point distance

Introduced as grey weighted distances (Rutovitz '68, Levi & Montanari '70) put in a fuzzy framework (Saha '02).

Define the distance along a path π_i between points x and y in the fuzzy set A

$$d_A(\pi_i(x, y)) = \int A(t) dt$$

Distances

Point to point distance

Introduced as grey weighted distances (Rutovitz '68, Levi & Montanari '70) put in a fuzzy framework (Saha '02).

Define the distance along a path π_i between points x and y in the fuzzy set A

$$d_A(\pi_i(x, y)) = \int A(t) dt$$

The distance between points x and y in A is the distance along the shortest path

$$d_A(x, y) = \inf_{\pi \in \Pi(x, y)} d_A(\pi)$$

out of all possible paths between x and y , $\Pi(x, y)$.

Distances

Point to point distance

Membership as another dimension
integrate the arc-length

Bloch 1995, Toivanen 1996:

$$d_A(\pi) = \int \sqrt{1 + \left(\frac{dA(t)}{dt}\right)^2} dt$$

Distances

Point to point distance

Membership as another dimension
integrate the arc-length

Bloch 1995, Toivanen 1996:

$$d_A(\pi) = \int \sqrt{1 + \left(\frac{dA(t)}{dt}\right)^2} dt$$

Problem: Scale of membership relative to spatial distance

- Most often, task of image analysis is to provide information about the **real continuous** imaged unavailable object, based on its **discrete representation** in the image.
- Discretization causes unavoidable loss of information, therefore recovering of this information cannot be complete.
- **Estimation** of relevant features of the continuous original, based on its discrete representation is, therefore, what remains. Various algorithms are proposed.

Estimation of features

- Fuzzy representations **preserve more information** than crisp ones. How to utilize that information to get better (more precise) estimates of object features?

Estimation of features

- Fuzzy representations **preserve more information** than crisp ones. How to utilize that information to get better (more precise) estimates of object features?
- Shape descriptors, estimated from fuzzy digital object representations are shown to be **more precise** than those obtained from crisp shape representations.

Estimation of features

- Fuzzy representations **preserve more information** than crisp ones. How to utilize that information to get better (more precise) estimates of object features?
- Shape descriptors, estimated from fuzzy digital object representations are shown to be **more precise** than those obtained from crisp shape representations.
- Estimation of
 - area
 - higher order moments
 - ... in 2D and 3D
 - perimeter and surface area
 - projections
 - distances

are some of the features studied by now.

Estimation of features

- **Estimation error** - shows how good estimate is (in the worst case, or on average, or...).

Estimation of features

- **Estimation error** - shows how good estimate is (in the worst case, or on average, or...).
- In case of a general fuzzy membership function, error is observed in statistical studies.
- If stronger assumptions are made about the membership function, **theoretical error bounds** for the estimates can in some cases be derived.

Estimation of features

- **Estimation error** - shows how good estimate is (in the worst case, or on average, or...).
- In case of a general fuzzy membership function, error is observed in statistical studies.
- If stronger assumptions are made about the membership function, **theoretical error bounds** for the estimates can in some cases be derived.
- It is shown that the precision of estimates increases both with an increase of spatial and of **membership resolution** (number of membership levels - grey levels- used for representation).

Estimation of features

- **Estimation error** - shows how good estimate is (in the worst case, or on average, or...).
- In case of a general fuzzy membership function, error is observed in statistical studies.
- If stronger assumptions are made about the membership function, **theoretical error bounds** for the estimates can in some cases be derived.
- It is shown that the precision of estimates increases both with an increase of spatial and of **membership resolution** (number of membership levels - grey levels- used for representation).
- For **pixel coverage** based membership function, estimation error bounds are derived for some descriptors.

Estimation of features

- It is possible to compensate for insufficient spatial resolution by using available grey levels for representing partial memberships!

Estimation of features

- It is possible to compensate for insufficient spatial resolution by using available grey levels for representing partial memberships!
- Only a few membership levels can significantly improve the performance of a descriptor. However, it is noticed that there should always be a balance between these two resolutions, to obtain good results.

Conclusions, Part I

- Spatial fuzzy sets are of a particular interest in image analysis.
- Features of spatial fuzzy sets - shape descriptors.
- “Horizontal” and “vertical” approach in definitions.
- Generalizations are numerous, find the one that suits you.
- High precision estimation - often a particular membership functions considered.
- Spatial and membership resolution - compensate one for another.
- A number of features are generalized and defined for fuzzy shapes, but still many are left.
- Fuzzy values?

Defuzzification

But what if we, after all, want to get back to crisp shapes and traditional image processing tools?

Defuzzification

Definition

Defuzzification is a process that maps a fuzzy set to a crisp set.

Defuzzification

Definition

Defuzzification is a process that maps a fuzzy set to a crisp set.

Approaches

- Defuzzification to a point.
- Defuzzification to a set.

Defuzzification

Definition

Defuzzification is a process that maps a fuzzy set to a crisp set.

Approaches

- Defuzzification to a point.
- Defuzzification to a set.

Goals

- Generating a good representative of a fuzzy set.
- Recovering a crisp original set.

Defuzzification to a point

Defuzzification

An application
in image
processing

- **Maxima methods and derivatives**
Selection of an element from the core of a fuzzy set as defuzzification value. Main advantage is simplicity.
- **Distribution methods and derivatives**
Conversion of the membership function into a probability distribution, and computation of the expected value. Main advantage is continuity property.
- **Area methods**
The defuzzification value divides the area under the membership function in two (more or less) equal parts.
